EE2026: DIGITAL DESIGN

Academic Year 2020-2021, Semester 2

LAB 3: Sequential Circuits in Verilog - Part 1

OVERVIEW

A sequential circuit is one where the outputs depend on the current inputs and the sequence of past inputs. As a result, a sequential circuit has memory, also called states. In this lab, some basic sequential circuits will be designed to make an LED blink at various speeds.

The pre-requisites for this lab are:

- A very good understanding and application of dataflow modelling and structural modelling in designing modules.
- Knowing how to use the Vivado IDE well.
- Familiarity and knowledge on how to use "Set as Top", "reg" and "wire".

This lab will cover the following:

- Using a signal that inverts itself periodically, which shall be called CLOCK.
- Making a physical LED blink by using the Basys 3 development board clock signal.

Tasks for this lab include:

- Creating a slower clock from a faster clock.
- Having a physical LED blink noticeably on the Basys 3 development board, by using the slower clock.
- Using a switch to make a physical LED blink at two different speeds on the Basys 3 development board.

GRADED ASSIGNMENT [LUMINUS SUBMISSION: FRIDAY 26th FEBRUARY 2021, NOON]:

• Display different LED patterns at different time instants and display periodically changing characters on the 7-segment displays of the Basys 3 development board

Further details are available at the end of this lab manual.

THE BLINKING LED

A simple blinking LED is required to be implemented on the FPGA. To do this, a new signal, CLOCK, will be introduced.

The **CLOCK** signal is an external input signal that resembles a square wave of 50% duty cycle. If this **CLOCK** signal is connected directly to a physical LED, the latter will light up when the signal is HIGH, and will switch off when the signal is LOW, as illustrated in **Figure 3.2**.

Figure 3.2: A CLOCK signal with 50% duty cycle

A simple dataflow description in Verilog for a blinky module is written first, followed by a simulation source to verify the design. To create the square wave, or **CLOCK** signal, in the simulation source, a new section of codes will now be introduced:

Verilog code for blinky, using the dataflow method

```
module blinky (input CLOCK, output LED);
    assign LED = CLOCK;
endmodule
```

Simulation source code to test the blinky design

```
`timescale 1ns / 1ps

module test_blinky();

   reg CLOCK; wire LED;

   blinky dut (CLOCK, LED);

   initial begin
        CLOCK = 0;
   end

   always begin
      #5 CLOCK = ~CLOCK;
   end

endmodule
```

Expected simulation waveform for the blinky design

UNDERSTANDING | TASK 2

Based on the Verilog code and simulation results, check your understanding by answering the following questions:

- 1. What is the unit of time being used in the simulation source?
- 2. Every 5 units of time, the value of **CLOCK** is being inverted. What is the clock frequency being used in this simulation?
- 3. What would happen if the testbench code CLOCK = 0 is removed?

For the hardware implementation, instead of using an external signal generator for the **CLOCK** signal to the Artix-7 FPGA, the Basys 3 development board includes a single 100 MHz clock generator connected to pin W5 of the Artix-7 FPGA.

Using the original contents of the Basys3_Master.xdc in your constraint file, follow these steps:

- 1. Uncomment lines 7 to 9 to create a clock signal of 100 MHz with 50% duty cycle. If required, rename the signal to the name used in your **blinky** code. In our example, the name **CLOCK** was used, and the final changes may look similar to **Figure 3.3**.
- 2. Configure the output signal **LED** that is present in your **blinky** code (or the name chosen by you while writing the code) by linking it to any physical LED on the Basys3 development board.

```
1 ## This file is a general .xdc for the Basys3 rev B board
2 ## To use it in a project:
3 ## - uncomment the lines corresponding to used pins
4 ## - rename the used ports (in each line, after get_ports) according to the top level signal names in the project
5
6 ## Clock signal
7 set_property PACKAGE_PIN W5 [get_ports_CLOCK]
8 set_property IOSTANDARD LVCMOS33 [get_ports_CLOCK]
9 create_clock -add -name sys_clk_pin -period 10.00 -waveform {0 5} [get_ports_CLOCK]
11 ## Switches
12 #set_property PACKAGE_PIN V17 [get_ports {sv[0]}]
13 #set_property IOSTANDARD LVCMOS33 [get_ports {sv[0]}]
14 #set_property PACKAGE_PIN V16 [get_ports {sv[1]}]
15 #set_property IOSTANDARD LVCMOS33 [get_ports {sv[1]}]
```

Figure 3.1: Modifying your constraint file, based on the contents of the Basys3_Master.xdc

UNDERSTANDING | TASK 3

You may optionally generate the bitstream and upload your code to the Basys3 development board. What do you "notice" about the "blinking" LED?

THE NOTICEABLE BLINKING LED

To be able to observe a blinking LED at a frequency that is visible to the human eyes, modifications need to be done to the Verilog code. Let us introduce a temporary variable **COUNT** that is incremented by 1 at every rising edge (transition from low to high, and also called a positive edge) of the **CLOCK** signal, as shown in **Figure 3.4**. By making use of **COUNT**, a lower frequency signal can be obtained, while the Verilog code for **COUNT** can be created by using the behavioural method of modelling.

Figure 3.4: Increasing COUNT at each rising edge of CLOCK

Verilog code for a slower blinky, using behavioural modelling

endmodule

UNDERSTANDING | TASK 4

Create a simulation source for the slow_blinky_module design, and observe the waveform of signal COUNT.

[NOTE] Analysing a variable in the simulation waveform window

By default, the simulation window only shows the waveforms of input and output signals. To see the waveforms of variables during the simulation, such as the variable **COUNT**:

- 1. Select the dut under the simulation module being used
- 2. In the **Objects** window, right click on the **COUNT** variable
- 3. Choose Add To Wave Window

After adding the variable **COUNT** to the wave window, the current simulation needs to be re-run. Follow these steps:

- 1. Restart the simulation
- 2. Set the simulation time and units
- 3. Run the simulation for the amount of time set in step 2

The **COUNT** variable can then be expanded by clicking on the + symbol to the left of **COUNT**. This allows for every individual bit to be observed as independent waveforms:

UNDERSTANDING | TASK 5 * Warning: Do not simulate the code. Why? *

Using the knowledge and coding obtained from **UNDERSTANDING | TASK 3** and **UNDERSTANDING | TASK 4**, calculate the minimum size of **COUNT** and the bit number which will allow a clock output of around 0.75 Hz.

Minimum of bits required for COUNT :	Bit number of COUNT :

Name that waveform with the frequency of 0.75 Hz as **SLOWCLOCK_A**. Modify the **slow_blinky_module** design, and implement the LED blinking at a frequency of around 0.75 Hz on the Basys 3 development board.

UNDERSTANDING | TASK 6

In the **slow_blinky_module**, insert the following line of code in the always block:

```
always @ (posedge CLOCK) begin
   COUNT <= COUNT + 1;
   LED <= ( COUNT == 4'b0000 ) ? ~LED : LED ;
end</pre>
```

Do additional modifications in the **slow_blinky_module** and the testbench code, and simulate the **slow_blinky_module** design.

[NOTE] Hints on the modifications related to slow_blinky_module

- ▶ LED is an output signal of the design module
- A signal declared as reg can be reused within the design module. An example is an output signal that needs to be reused as input within the design module
- ▶ A design module signal declared as reg can be given an initial value, especially if toggling is involved

If the codes have been correctly written, a simulation waveform similar to what is shown below can be obtained:

Observe the waveform that you have obtained in your simulation window, and calculate the frequency of the signal LED:

$$f = MHz$$

From your understanding of the multiplexer, state what the following line of code means:

```
LED <= ( COUNT == 4'b0000 ) ? ~LED : LED ;
```

UNDERSTANDING | TASK 7 * Warning: Do not simulate the code. Why? *

Using the knowledge and coding obtained from UNDERSTANDING	TASK 6, calculate the number of bits for	COUNT
which will allow LED to have a frequency of around 0.75 Hz.		

Number of bits required for COU	NT:
---------------------------------	-----

Name that waveform with the frequency of 0.75 Hz as **SLOWCLOCK_B**. Modify the **slow_blinky_module** design, and implement the LED blinking at a frequency of around 0.75 Hz on the Basys 3 development board.

Finally, modify and implement the Verilog code such that there are two blinking speeds for the LED based on the state of a switch:

- If the switch is in the OFF position, the LED should blink at a frequency of around 0.75 Hz
- If the switch is in the ON position, the LED should blink at a frequency of around 1.50 Hz

One way to accomplish this task is to use multiplexers in Verilog. It may also be implemented using other methods that involve conditional statements.

GRADED POST-LAB ASSIGNMENT

SUBTASK A [Status]

This lab 3 graded assignment is divided into two subtasks for ease of understanding. In subtask A, we assume the Basys 3 development board is being used to monitor the water level status in a water reservoir. In your program, all characters appearing on the seven-segment displays must follow *Table A*, as shown below:

Table A

Throughout your program, the following seven-segment displays must be activated depending on the 1st (First) rightmost numerical value of your student matriculation number, as indicated in *Table B*:

Seven-segment displays that are required to be always ON or OFF				
1 st (First) rightmost numerical value of	AN3	AN2	AN1	AN0
your student matriculation number	Display	Display	Display	Display
0	ON	ON	ON	ON
1	ON	ON	ON	OFF
2	ON	ON	OFF	ON
3	ON	ON	OFF	OFF
4	ON	OFF	ON	ON
5	ON	OFF	ON	OFF
6	ON	OFF	OFF	ON
7	ON	OFF	OFF	OFF
8	OFF	ON	ON	ON
9	OFF	ON	ON	OFF

Table B

Before the start of your program, switches SW0 to SW15 must be in the OFF position. When the program starts, LD0 to LD15 are OFF, and the seven segment displays do not show any characters (All 7 segments and decimal point segment are off).

Based on the 3rd rightmost value of your student matriculation number, your 'Entry Valve Level (EVL)' is as indicated in Table C:

3 rd (Third) rightmost numerical value of	Entry Valve	Corresponding	Water Release Interval
your student matriculation number	Level (EVL)	EVL-LED	at EVL-LED (in seconds)
0 or 1	15	LD15	1.33 seconds
2 or 3	14	LD14	1.33 seconds
4 or 5	13	LD13	1.33 seconds
6 or 7	12	LD12	2.67 seconds
8 or 9	11	LD11	2.67 seconds

Table C

LD0 represents the bottom of the water reservoir, while the top of your water reservoir is represented by **EVL-LED**.

At regular intervals indicated in *Table C*, water is released at the **EVL**. That water drop is represented by one LED being ON, and the water is always clearly observed to start from the **EVL-LED** right from the start of the program. It falls towards the bottom of the reservoir and stops one LED above the current reservoir water level. The water drops always fall at a speed of 3 Hz (In other words, the LED which is ON moves to the next adjacent lower value LED every 0.33 seconds)

As soon as all LEDs from LD0 to **EVL-LED** are ON, the water reservoir is considered full, water stops flowing into the reservoir, and the following two events (Event 1 and Event 2) are observed at the same time:

Event 1:

EVL-LED blinks at a frequency that is dependent on the **4**th **rightmost value** of your student matriculation number, and as indicated in *Table D* below:

4 th (Fourth) rightmost numerical value of your student matriculation number	Frequency, f_{BLINK} (An error \pm 0.1 Hz for the frequency is acceptable)
0 or 2 or 4	1.49 Hz
1 or 3 or 5	0.75 Hz
6 or 7 or 8 or 9	0.37 Hz

Table D

Event 2:

Characters must be shown on your activated seven-segment displays in a specific sequence, depending the **4**th **rightmost value** of your student matriculation number, and as indicated in **Figure E** and **Table E**:

All your activated anodes must show the SAME character at a specific clock cycle.

[DO NOT show different characters simultaneously]

Figure E

4 th (Fourth) rightmost numerical value of your	Character 1 ▶ Character 2 ▶ Character 3 ▶ ▶ Last
student matriculation number	Character ▶ Repeat from Character 1
0	.CAUTION-CHECK
1	.WARNING-NOTICE
2	.HIGH-WATER-LEVEL
3	.HIGH-LEVEL
4	.WATER-LEVEL-CAUTION
5	.ATTENTION
6	.RELEASE-WATER-NOW
7	.WARNING-LEVEL
8	. DANGER
9	.DANGER-WATER-LEVEL

Table E

Note that the first character is always a dot (.) and each character must stay on for 0.67 seconds (An error of ±0.05 seconds is acceptable). Marks are not awarded if any character (coloured in red) is missing, including the dash (-) character where applicable.

SUBTASK B [Action for Flooding Emergencies]

This Status and Action for Flooding Emergencies (SAFE) system has an additional feature to discharge water when the reservoir is full. The user may start the process to fully discharge water from the reservoir by opening several discharge valves, and this process can only happen when the water reservoir is full. **Discharging water from the reservoir when it is not full must not be allowed.**

The discharge valves are represented by switches SW0 to SW15 on the Basys 3 development board. When the user turns ON a specific switch, it is assumed that the discharge valve corresponding to that switch will be permanently opened, even if that switch is turned OFF again.

The correct switches that must be turned ON or were previously ON, are indicated by:

- (a) The rightmost 5 individual numerical digits of your student matriculation number AND
- (b) The rightmost 3 individual numerical digits of your student user ID, with each individual digit increased by +6

If the correct switches are ON or were previously ON, water starts discharging immediately from the reservoir, with one additional LED being turned OFF at a frequency of f_{OFF} and starting from **EVL-LED** towards LDO. The frequency f_{OFF} is dependent on the **3**rd **rightmost value** of your student matriculation number, as shown in **Table F**:

3rd (Third) rightmost numerical value of your student matriculation number	Frequency, f_{OFF} (An error \pm 0.1 Hz for the frequency is acceptable)
0	6.00 Hz
1	3.00 Hz
2	6.00 Hz
3	3.00 Hz
4	1.50 Hz
5	3.00 Hz
6	1.50 Hz
7	0.75 Hz
8	1.50 Hz
9	0.75 Hz

Table F

When all the LEDs are OFF, the segment displays must then show blank characters (Segment LEDs are OFF). The program ends here.

Assume that the user will not turn on the wrong switches. Even if the wrong switches are turned ON, it can be ignored.

Hint: Use a stopwatch to manually verify whether you have used the correct frequencies in this SAFE system

EXAMPLE BASED ON YOUR STUDENT MATRICULATION CARD NUMBER

Fully understand this example before working on your assignment.

If a student has matriculation number "A0128228Y" and user ID "e0123277" then:

- 1st rightmost digit is 8: The rightmost 3 seven-segment displays out of the 4 seven-segment displays will be ON

wherever required during the running of the program

- 3rd rightmost digit is 2: The EVL is 14, and the EVL-LED is LD14. A new drop of water (New LED light up at EVL-LED)

appears every 1.33 seconds

Water is discharged from the water reservoir at a frequency f_{OFF} = 3.00 Hz (One LEDs turn OFF

every 0.33 seconds)

- **4**th **rightmost digit is 8:** The characters to appear sequentially on the activated seven segment displays are:

. \triangleright D \triangleright A \triangleright N \triangleright G \triangleright E \triangleright R \triangleright . \triangleright D \triangleright A \triangleright N \triangleright G \triangleright E \triangleright R \triangleright . \triangleright D ...

To discharge water when the reservoir is full, the correct switches that must be turned ON or were previously ON are:

SW2, SW8, SW13

(This example continues in the next page)

HINTS

- Complete and understand UNDERSTANDING | TASK 7 clearly before working on this assignment
- Excellent mastery of structural modelling and instantiation is recommended, to properly send signals from one instance to other instances
- Creating different modules for different functions, and then simulating them before instantiating them in a main module will make complex systems easier to debug
- Use multiplexers to select between different clock signals coming from multiple clock dividers
- A counter whose value can change at each clock cycle can be considered. For example, that counter can count 0, 1, 2, 3, 0, 1, 2, 3 etc ... Following that, if-else statements, multiplexers, or case statement that indicates what to do at each specific counter value can be created

Case statements are recommended here, and the case statement template is given below.

```
case (expression)
   case_item: statement or statement_group
   case_item: statement or statement_group
   default: statement or statement_group
endcase
```

• An example in using case is given below. Note that case statements (if-else statements also) must lie within an always block:

```
always @ (posedge clk 25 mhz)
begin
   case (counter value)
      2'd0:
          begin
                  my value a <= 20;
                  my_value_b <= 40;</pre>
           end
       2'd1:
           begin
                  my value a <= 100;
                  my_value_b <= 200;
           end
       2'd2: my value c <= 5;
       default: my_value_d <= 9;</pre>
   endcase
end
```

- Be careful of parallel execution of the always blocks. Multi-driven nets indicate that there are conflicting values being given to the same signal from different always blocks. For example, one cannot tell a signal to increase at a time instant t, and at that same time instant t, telling it to decrease
- Refer to http://tiny.cc/ee2026wiki for more details on commonly encountered errors.

LUMINUS SUBMISSION INSTRUCTIONS

- Complete as much required functionalities <u>as possible within the given deadline</u> and ensure that your bitstream has been successfully generated and tested on your Basys 3 development board <u>BEFORE</u> archiving your Vivado workspace for LumiNUS upload. No working bitstream is equivalent to no marks (It is best to have some working functionalities / requirements, instead of not having any bitstream at all while trying all requirements)
- It is compulsory to archive your project in a compressed form without any simulation waveforms. In the uploaded archive, the codes (.v files) are important, not the waveforms (.wdb files). The archive size should not exceed 3 MB in size for lab 3. Follow the instructions given in the pdf: "Archive Project in Vivado 2018.02"
- <u>After</u> following the instructions in "Archive Project in Vivado 2018.02", rename your project archive as indicated in the appendix of this lab manual.
- There are no report submissions for this lab assignment
- Upload to LumiNUS EE2026 -> Files -> Lab and Project Materials and Submissions -> Lab 3 Submission
- Download your LumiNUS archive after uploading. Unzip the project folder within, open the program, and check if you can run your bitstream correctly. No project files and no working bitstream is equivalent to losing all marks
- The LumiNUS upload must be completed by **Friday 26th February 2021, 12:00 P.M. (Noon)**. Do not plan to upload during the grace period of 2 hours
- A penalty of 25% applies for late submissions of up to 1 week
- The late submission folder closes 1 week after the original deadline. Late submissions are not accepted and not graded if a submission is found within the on-time folder, or if grading has already started on an earlier submitted file. The late submission folder will be located at: LumiNUS EE2026 -> Files -> Lab and Project Materials and Submissions -> Lab 3 Submission (Late Submission)

<u>Plagiarism is penalised with a 100% penalty for all SOURCES and RECIPIENTS</u>

All past and future submissions, and marks, will be reviewed in greater detail, for any person found to have plagiarised

ALL THE SUBMISSION INSTRUCTIONS LISTED ABOVE WILL AFFECT YOUR GRADES!

GRADING PROCESS

- During subsequent lab sessions, our graders will be providing you updates on the grading of your submission
- Submissions not following all the LUMINUS SUBMISSION INSTRUCTIONS (listed above) will not be graded immediately, and
 will instead be reviewed towards the end of the semester. You will not be able to see your results during the labs in such
 situations

APPENDIX (COMPULSORY renaming before just LumiNUS upload):

It is **compulsory to rename your project archive**, just before the LumiNUS upload, as listed in the table below. Do not change any other part of the naming. Simply **copy** the naming from the table below, and **paste** it while renaming your project archive. Penalties will be incurred if your submission cannot be found according to the exact naming template below.
